

Important information for customers who use Option .NMEA2000 for CANalyzer and CANoe

The following information is directed to operators and licensing parties of CANalyzer or CANoe software with Option .NMEA2000:

With the release of CANalyzer and CANoe Version 7.5, Option .J1939 and Option .NMEA2000 were combined. The name of the combined option is “Option .J1939.” Functional features of the “new” extended Option .J1939 consist of features of the previous Option .J1939 and Option .NMEA2000.

Vector created the uniform option for both use areas in response to requests by many users. Since coverage of the communication protocol of NMEA2000 is largely identical to that of SAE J1939, this step makes a contribution toward simplifying tool use.

Customers with a maintenance contract for Option .NMEA2000 will automatically get an Option .J1939 with the release of CANalyzer and CANoe Version 7.5.
